The Authenticity Crisis in Islamic Finance

A Critical Examination of Risk-Sharing, Profit Calculation,

and the "Debt Merchant" Paradox in Modern

Islamic Financial Institutions

A Socratic Inquiry into the Gap Between
Shariah Theory and Banking Practice

February 1, 2026

Introduction

Islamic finance rests on a premise so simple it is almost radical: money must serve the real economy, risk must be shared between those who provide capital and those who labor with it, and profit must be earned through genuine economic participation rather than extracted through contractual guarantee. The two foundational instruments of Islamic banking **Musharakah** (joint venture partnership) and **Mudarabah** (profit-sharing arrangement) give this philosophy its operational form. In Musharakah, both the financier and the entrepreneur contribute capital, share profits by agreement, and bear losses in proportion to their investment. In Mudarabah, the financier provides capital while the entrepreneur provides expertise and effort; profits are divided by a pre-agreed ratio, while financial losses fall on the capital provider.

But what happens when a philosophy enters the machinery of modern banking? Across the contemporary landscape of Islamic Financial Institutions (IFIs), a growing and uncomfortable body of evidence suggests that these noble principles have been diluted, repackaged, and ultimately subordinated to the same risk-free lending model that defines conventional finance. The Islamic label persists, but the substance, the willingness to genuinely share risk, to accept loss as a natural consequence of business, to trust in the outcome rather than guarantee the principal has largely evaporated.

This article presents a critical examination of modern Islamic banking through a series of probing questions. The inquiry begins

with a practical concern, how does profit calculation work without fixed interest? and progressively sharpens into a fundamental challenge: are modern IFIs truly Islamic in their financial conduct, or have they become what can only be called "debt merchants," institutions that have sugar-coated conventional lending with Shariah-compliant terminology while abandoning the very risk and trust that give Islamic finance its spiritual meaning?

1. The Mechanics of Profit: How Does One Calculate Returns Without Interest?

The first question is deceptively simple but strikes at the heart of what separates Islamic finance from its conventional counterpart. In conventional lending, the mathematics is uncomplicated: a bank lends one million dollars at 20% interest, and regardless of whether the borrower's business thrives, stagnates, or collapses, two hundred thousand dollars is owed at the end of the year. The bank's return is entirely decoupled from the borrower's reality. The business could be burning; the interest is still due.

In the Islamic model, this decoupling is supposed to disappear. The bank does not "lend" in the conventional sense it *invests*. If the bank provides one million dollars and agrees on a Profit Sharing Ratio (PSR) of 30:70 with the business, the bank's return becomes inseparable from the business's actual performance. If the venture generates $200,000 in profit, the bank receives $60,000 (30%) and the business retains $140,000 (70%). If there is zero profit, the bank receives zero. If there is a loss, the bank's capital diminishes.

The fortunes of the financier and the entrepreneur rise and fall together.

This naturally raises a practical question: in a world of variable business performance, where some years yield abundance and others yield nothing, how does a bank that depends on depositor confidence manage the volatility? Part of the answer lies in the Profit Equalization Reserve (PER) a mechanism through which banks set aside a portion of earnings during profitable years to smooth distributions during lean periods. It is a pragmatic solution, but it also introduces the first quiet tension between the theoretical purity of risk-sharing and the institutional compulsion toward predictability.

The Agency Problem: Who Guards the Books?

A sharper concern surfaces when one considers the information asymmetry built into any profit-sharing arrangement. If a bank's return depends on the borrower's reported profit, what prevents the borrower from inflating expenses to shrink the apparent surplus? In conventional banking, this problem barely exists the bank does not care how large the profit is, only that the debt is repaid. But in Islamic banking, the bank has become a stakeholder, and every line item in the borrower's books directly determines the bank's return.

Contemporary IFIs address this "moral hazard" through several overlapping mechanisms. They reserve the contractual right to audit the business's financial records at any time, typically mandating compliance with AAOIFI (Accounting and Auditing Organization for Islamic Financial Institutions) standards. They conduct rigorous feasibility studies before investing, establishing

sector benchmarks against which performance is measured; if a business in an industry that typically earns 20% suddenly reports 2%, a forensic audit is triggered. Some banks employ incentive structures designed to align interests: profits are shared 50/50 up to a benchmark return, but anything earned above that threshold is retained entirely by the entrepreneur as a "management bonus," thereby motivating honest and complete reporting.

These safeguards are reasonable in principle. But they also reveal something important: the monitoring costs of genuine profit-sharing are substantially higher than those of conventional lending. This cost differential has profoundly shaped the direction of modern Islamic banking and not, as we shall see, in the direction of its founding principles.

2. The Risk-Sharing Illusion: Do Islamic Banks Actually Share Risk?

Here the inquiry sharpens. If the theoretical foundation of Islamic finance is the genuine sharing of risk, then IFIs should have a demonstrable record of absorbing losses when businesses fail. After all, conventional banks even with their supposedly guaranteed interest routinely lose money when borrowers declare bankruptcy. Some recover partially through collateral; many do not. Do IFIs similarly bear the consequences of business failure, as their philosophy demands?

Collateral in Islamic Finance

The answer begins with an uncomfortable fact: yes, IFIs collect collateral, substantially as conventional banks do. The Islamic legal mechanism is called **Rahn** (pledge), and in virtually all modern Islamic financing whether Murabaha, Diminishing Musharakah, or otherwise the bank requires security. This may be the financed asset itself or a separate property pledged against the arrangement.

There is, in fairness, a structural difference in how collateral is treated upon default. When a conventional bank sells seized collateral, it recovers the outstanding principal plus all accumulated interest. An Islamic bank, by contrast, may only recover its outstanding principal and actual costs incurred; any surplus from the collateral sale must be returned to the borrower, as the bank cannot profit from the borrower's misfortune beyond the original agreed-upon terms. This distinction is real but it is a distinction of degree, not of kind. The fundamental dynamic remains identical: the bank secures itself against loss through the borrower's assets, effectively insulating its capital from the very risk it claims to share.

The Murabaha Escape Route

Perhaps the single most revealing statistic in contemporary Islamic banking is this: **80–90% of Islamic bank financing is conducted through Murabaha (cost-plus sale), not through Musharakah or Mudarabah.** In a Murabaha transaction, the bank purchases an asset a piece of equipment, a shipment of raw materials and immediately resells it to the customer at a fixed markup. The customer repays in installments. The "profit" is locked in at the point of contract; the bank never

needs to verify actual business performance, audit expenses, or share in any outcome whatsoever. The entire agency problem is sidestepped not solved, not wrestled with, but simply avoided.

Similarly, **Diminishing Musharakah**, widely used for home financing, structures the arrangement as shared property ownership. The bank and the customer co-own the asset; the customer gradually purchases the bank's shares over time while paying "rent" on the portion not yet owned. The rental rate is pegged to market benchmarks, not to the customer's income or the property's performance. The risk of total property destruction is theoretically shared in proportion to ownership but in practice, the asset provides collateral, and the rental income stream is functionally indistinguishable from a conventional mortgage repayment schedule.

Reported Losses: What the Record Actually Shows

The critical question persists: how many IFIs have actually lost money through genuine risk-sharing? The historical record provides a handful of institutional failures, the Islamic Bank of South Africa collapsed in 1997 due to poor credit management and insider lending; Ihlas Finance House in Turkey was shut down in 2001 due to excessive exposure to a small number of industrial groups; Bank Islam Malaysia Berhad reported a staggering loss of nearly RM 457 million in 2005 from writing off failed investments.

But here is the critical observation: ***none of these failures were caused by the institution honoring its risk-sharing obligations to borrowers.*** They were caused by internal mismanagement, insider corruption, and inadequate due diligence

the same institutional pathologies that bring down conventional banks. The failures do not demonstrate that IFIs share risk with their clients; they demonstrate that IFIs, like all financial institutions, are vulnerable to their own governance failures. The question of whether a modern Islamic bank has ever willingly absorbed a business loss because its Musharakah partner's venture failed without pursuing collateral, without legal recovery, in the spirit of genuine shared liability remains conspicuously unanswered.

3. The "Debt Merchant" Critique: Trust in Money vs. Trust in the Creator

Here the inquiry transcends mechanics and enters the realm of conviction. The critique can be stated with unflinching directness: modern IFIs have become "debt merchants" who deploy trade-based contracts to manufacture the same guaranteed-return outcomes as conventional banks, while dressing the arrangement in the vocabulary of Shariah compliance. They want absolute safety of capital zero genuine risk. And in doing so, they have made an unconscious but profound theological choice: they have placed their institutional trust in collateral, contracts, and legal guarantees rather than in the productive capacity of human enterprise and the provision of Allah.

This is not merely a financial failing; it is a failure of **Tawakkul**, the Islamic principle of trusting in Allah (God) while taking meaningful action. Tawakkul does not mean passivity or recklessness. It means committing wholeheartedly to a course of action and accepting the outcome as divinely ordained. An IFI that

refuses to invest in a venture unless it can guarantee recovery through collateral and fixed markups is not practicing Tawakkul. It is practicing the same risk-averse capitalism as any conventional bank, merely with Arabic terminology.

The Soldier Who Would Not Fight: A Jihad Analogy

There is, in Islam, a concept that illuminates this point with extraordinary clarity: **Jihad**, striving in the path of Allah. In its most literal and foundational sense, Jihad includes the willingness to go into battle. Consider the soldier who marches toward the front line. He does not march to die. He marches to fight, to prevail, and to return with honor and with gain. His ***expectation* is victory**. His *acceptance* includes the possibility of death. He is not on a suicide mission. He has trained, he has prepared, he has assessed the terrain. But he cannot demand a contractual guarantee of survival before he will step onto the battlefield. If he did, if he told his commander, "I will only fight if you guarantee I will not be harmed", that would not be Jihad. That would be cowardice dressed in the language of prudence.

> *The battle is raging. The entrepreneur stands at the front line of economic creation, risking labor, reputation, and livelihood. Behind him stands the financier. The question is whether that financier is a fellow soldier sharing the danger, sharing the reward or a spectator in an armored tower, demanding bounty without exposure.*

This is precisely the situation with modern Islamic banking. The entrepreneur is the soldier on the battlefield of commerce. The business is the battle, uncertain, volatile, full of risk and potential. The IFI, by insisting on Murabaha markups, collateral seizure rights, and fixed-return structures, has effectively demanded a guarantee of survival before it will engage. It wants the bounties of the battlefield, the profit, the return, the growth without ever truly stepping onto it. It has armored itself so completely against loss that it can no longer claim to be fighting the same fight as the entrepreneur.

In the authentic Islamic model, the financier *is* the fellow soldier. He provides capital the way a comrade provides reinforcement with the shared expectation of return, and the shared acceptance that the battle may not go as planned. He expects the bounties. He works toward the bounties. He has done his due diligence, assessed the venture, and committed his resources with conviction. But he does not demand a signed guarantee of survival. His trust is not in the contract alone; it is in the quality of the enterprise, the competence of the entrepreneur, and ultimately in **Allah's provision**. This is Tawakkul in its most economically productive form and it is precisely what modern IFIs have abandoned.

The Hierarchy of Virtue: Why Venture Financing Surpasses Both Charity and Risk-Free Lending

Islamic scholarship recognizes a hierarchy of financial virtue that should give every modern IFI pause. The reward for providing a loan (**Qard**) is higher, than the reward for charity (**Sadaqa**). The reasoning is illuminating: the person seeking a loan is typically an active economic participant, an entrepreneur, a craftsman, a trader, someone who wishes to *produce*, not merely to *consume*. The

person seeking charity is in immediate need. The loan enables productive capacity and economic dignity; the charity meets immediate survival.

But let us take this hierarchy to its logical extension. If a simple loan carries higher reward, what is the standing of a loan that also participates in the venture's success, that finances the entrepreneur *and* shares in the profit when profit comes? This is not Qard Hassan in the narrow sense of a profit-free, interest-free loan given purely as charity. This is something higher: **a commitment of capital to another human being's productive enterprise, with the expectation of shared return, and the acceptance of shared risk.** No one receives a free meal. The entrepreneur is held accountable to repay the capital and to share the profits as they materialize. The financier is held accountable to accept the outcome, whether abundant or barren, as part of the agreement and part of divine decree.

By this measure, modern IFIs have positioned themselves at the lowest rung of the Islamic virtue hierarchy. They provide capital with neither the generosity of true charity nor the courage of genuine partnership. They have manufactured a third category that Islam never envisioned: risk-free extraction guaranteed return with no genuine exposure cloaked in the aesthetics of compliance.

4. The Untapped Engine: Current Accounts and a Pragmatic Path to Venture Finance

Perhaps the most provocative dimension of this inquiry concerns the vast pools of capital sitting in customer current accounts at Islamic banks/IFIs and the question of what could be done with them, not recklessly, but with disciplined pragmatism.

The Zero-Cost Capital

In both conventional and Islamic banking, current account deposits carry zero or near-zero cost to the institution. In conventional banks, this is the primary engine of the **Net Interest Margin**: the bank pays nothing to the depositor and charges the borrower 5–10%, capturing the entire spread as profit. Islamic banks benefit from the identical dynamic. In many IFIs, current accounts are legally structured as **Qard** (a loan from the customer to the bank) or **Wadi'ah** (safekeeping). The bank guarantees the principal and claims the right to deploy those funds and retain whatever profit they generate. The cost of this capital to the bank is, for all practical purposes, zero.

This is not a contested point. It is the foundational arithmetic of banking conventional and Islamic alike. And it leads to the central question: if the capital is effectively free, why is it not being channeled into the one form of financing that Islamic jurisprudence most emphatically endorses genuine, risk-bearing, profit-sharing support for entrepreneurship and new ventures?

A Practical Proposal: Proportional Deployment, Not Reckless Exposure

To be clear, the argument here is not that IFIs should deploy *all* of their current account capital into venture financing. That would be imprudent by any standard. The argument is proportional and pragmatic. If an IFI's current account base yields, say, a 10% expected return from its existing conservative deployments, then that 10% margin, the profit generated from zero-cost capital represents a pool that *could* be allocated to genuine entrepreneurial finance without endangering the underlying deposit base.

The logic is self-reinforcing. As entrepreneurial ventures succeed and generate returns, a portion of those returns can be recycled into further venture deployments, gradually expanding the pool of risk-bearing capital. Success breeds capacity. The IFI is not gambling its depositors' principal; it is deploying its own earned margin capital that was generated at no cost into the very form of economic activity that Islamic finance was designed to support. At no point does the institution risk falling below its capital obligations or liquidity requirements. It is making a practical, pragmatic, measured decision precisely the kind of calculated engagement that a well-prepared soldier makes before entering the field.

The Financing Model: Not Charity, But Accountable Partnership

It must be emphasized that what is being proposed here is **not** interest-free, profit-free lending in the narrow sense of Qard Hassan as pure charity. No one should receive a free meal without liability. The entrepreneur who receives capital from the IFI is

expected to *repay the principal* and to *share a portion of the profits* as they materialize not through a trade-financing mechanism, not through a contrived asset purchase, but through a direct, transparent agreement: the bank provides capital, the entrepreneur deploys it in a genuine business venture, and the profits are shared as they arise. If a year yields no profit, neither party extracts from the other. If the venture succeeds, both parties benefit. If the venture ultimately fails despite honest effort, the loss is shared as the original agreement stipulated.

This is Musharakah in its purest and most authentic form. It does not require the intermediary fiction of buying and reselling assets. It does not require a fixed markup that transforms partnership into debt. It requires only what Islamic finance was always meant to require: **capital, trust, accountability, and the courage to accept an outcome that is not guaranteed.** The soldier does not demand the battlefield be cleared of all danger before he advances. He advances because the cause is worthy, the preparation is sound, and the outcome belongs to Allah.

The Transparency Question: How Much of This Already Exists?

It would be disingenuous to claim that no IFI anywhere engages in any form of genuine venture support. Some may. The question is how much, and what is its real impact? The visible product offerings of most IFIs, the ones marketed to customers, published in annual reports, and displayed in branch windows are overwhelmingly dominated by Murabaha, Diminishing Musharakah, and other trade-based instruments. If genuine profit-sharing venture financing exists, it appears to operate in the shadows: selectively extended, invisibly allocated, and available

primarily through insider channels rather than through transparent, publicly accessible programs.

A financial system that offers its most authentically Islamic product only to the well-connected few, while marketing risk-free debt instruments to the general public, is not practicing Islamic finance. It is practicing **selective patronage** a system in which access to genuine partnership depends not on the quality of one's enterprise but on the depth of one's connections. This is the opposite of the equal-opportunity, community-oriented economic vision that Shariah envisions.

5. The Gap Between Shariah Theory and Banking Practice

When one assembles the full picture the dominance of trade-based instruments, the collection of collateral, the avoidance of genuine loss-sharing, the selective deployment of venture capital, what emerges is not a financial system faithful to its principles but one that has systematically replaced substance with form. The following comparison distills this gap across its most critical dimensions:

Dimension	Shariah Theory (Intended)	Modern IFI Practice (Actual)
Source of Trust	Tawakkul, trust in Allah and the productive capacity of the entrepreneur	Trust in collateral, legal contracts, and fixed markups
Capital Deployment	Directed toward shared ventures, entrepreneurship, and real economic activity	Directed primarily toward asset-backed trade deals (Murabaha) with locked-in returns
Outcome of Failure	Shared loss; the bank's capital is genuinely at risk alongside the entrepreneur	Collateral seizure; legal recovery of principal through foreclosure
Contractual Power	The borrower stipulates the conditions of the contract, as ordained by Allah	The IFI dictates non-negotiable terms; the borrower either accepts or is excluded
Wealth Dynamics	Wealth circulation; capital flows to productive enterprise across the community	Wealth concentration; enriches the already-wealthy while making capital prohibitively expensive for those lower in the economic hierarchy
Accessibility	Inclusive; designed to enable economic participation at every level	Prohibitive; the further down the economic ladder, the less one can

		productively participate
Current Account Funds	A natural vehicle for proportional deployment into venture support and entrepreneurship	Deployed into low-risk instruments to maximize margin; venture support is invisible or reserved for insiders
Spiritual Orientation	Purpose-driven; higher virtue in enabling enterprise with shared risk than in risk-free extraction	Legalistic; compliance with the letter of Shariah while abandoning its economic and spiritual intent

The Contractual Inversion

One dimension of this gap deserves particular emphasis. In Islamic jurisprudence, the *borrower* holds a position of dignity in the contractual relationship. The conditions of the contract are to be stipulated by the one seeking capital, within the bounds of Shariah, for it is the borrower who knows the nature of the venture, the timeline of return, and the realistic terms under which the enterprise can succeed. Allah has laid this principle in the Quran, instructing that the debtor dictates the terms of the agreement while the scribe records them faithfully.

Modern IFIs have inverted this entirely. The institution drafts the contract. The terms are non-negotiable. The borrower either accepts the IFI's conditions in full, the markup percentage, the repayment schedule, the collateral requirements or walks away

empty-handed. This inversion does not merely violate a procedural nicety; it restructures the entire **power dynamic of Islamic finance**. The result is a system that enriches the already-wealthy, concentrates capital in institutional hands, and makes productive economic participation progressively more prohibitive the further one descends the economic hierarchy.

The Contradiction with Zakat

This outcome is a direct contradiction of the foundational Islamic pillar of **Zakat** the obligatory circulation of wealth from those who have to those who need, designed precisely to prevent the hoarding of capital and to ensure that economic resources flow through the community like lifeblood through a body. Zakat exists because Islam recognizes a truth that modern IFIs have chosen to ignore: wealth that accumulates at the top and does not circulate downward is wealth that is spiritually dead, no matter how Shariah-compliant its paperwork.

When IFIs structure their products to guarantee capital preservation, to extract fixed returns, and to exclude those who cannot meet collateral requirements, they are building a financial system that drives wealth in exactly the wrong direction upward and inward, toward institutional coffers and existing wealth holders, rather than outward and downward, toward the entrepreneurs, small businesses, and communities that Islamic finance was designed to serve. The system becomes not a vehicle for economic inclusion but a barrier to it, a velvet rope with Arabic calligraphy, admitting only those who already possess what the system claims to provide.

6. Conclusion: The Courage to Step onto the Battlefield

The inquiry presented in this article does not argue that Islamic finance is inherently flawed. On the contrary: the foundational principles of Musharakah and Mudarabah represent one of the most ethically compelling alternatives to the interest-based financial system ever articulated, a vision in which capital serves labor, risk is genuinely shared, returns are anchored to real outcomes, and the dignity of the entrepreneur is preserved through partnership rather than subordination.

The problem is not with the principles. The problem is with the institutions that claim to implement them.

Modern IFIs, operating within a regulatory and competitive environment designed for conventional banking, have largely retreated from equity-based finance into debt-mimicking instruments. They have achieved Shariah compliance in form while abandoning Shariah intent in substance. They collect collateral like conventional banks. They fix markups like conventional banks. They avoid loss-sharing like conventional banks. They dictate non-negotiable terms to borrowers like conventional banks. They concentrate wealth upward like conventional banks. The only thing they do not do like conventional banks is call their profit “interest.”

The tools for a more authentic model already exist within Islamic jurisprudence. Musharakah provides a framework for genuine venture partnership. The vast pools of zero-cost current account deposits provide a capital base that can be proportionally and prudently deployed without endangering institutional solvency. The financing model need not be charity, it should not be. The

entrepreneur must repay the capital and share the profits. But the IFI must accept that **the return is not guaranteed,** that the profit will come when the venture succeeds and not before, and that the possibility of loss is the price of authentic participation in another human being's economic striving.

What is missing is not mechanism but courage.

> *The battlefield of entrepreneurship is raging. Across the Muslim world and beyond, millions of capable, industrious, God-conscious men and women stand ready to build, businesses, technologies, services, communities. They need capital. They need a partner who will march beside them, not a creditor who watches from behind fortified walls. They need a financial institution that embodies the same faith it professes: that provision comes from Allah, that risk is the companion of all worthy endeavor, and that the reward for enabling another person's productive labor is of a higher order than the reward for hoarding one's own capital in safety.*

The soldier expects to return. He expects the bounties of victory. He has prepared, he has trained, he has assessed the risks with clear eyes. But he *steps onto the battlefield*. He does not demand a guarantee of survival. He does not refuse to fight until his commanding officer signs a contract promising he will not be harmed. He trusts in his preparation, in his comrades, and in Allah's decree. And it is precisely this trust, this willingness to

accept the outcome while striving toward the best one, that makes his effort Jihad.

Until Islamic Financial Institutions find this courage, the courage to step off the fortified walls of Murabaha and onto the open field of genuine Musharakah, to deploy their zero-cost capital into the ventures of the faithful, to accept that partnership means *shared* outcome and not *guaranteed* outcome, the gap between Islamic financial theory and Islamic banking practice will remain the most significant unresolved tension in the modern Muslim economic project.

And the question will linger, uncomfortable and unavoidable:

In whom have the Islamic banks placed their trust, in the contract, or in the Creator?

- End-
